## error fixup

neighborhood is  $N_G(V_i) = \{V_j | (v_i, v_j) \in E(G)\}$

## degree sequences

these will be ascending, book is descending

### definitionn

if  $G$  is finite with  $V(G) = \{v_1, \dots, v_n\}$  such that  $d_i = \deg(v_i) \leq \deg(v_j)$  for  $i \leq j$  then  $(d_1, \dots, d_n)$  is the degree sequence of  $G$ .

$d = (3, 3, 3, 3)$  three regular graph

$d = (2, 3, 3, 3, 3, 4)$

## Havel, Hakimi thm

if  $(d_1, \dots, d_n)$  is a non decreasing sequence with  $d_n \geq 1$  (avoid the empty graph) it is a degree sequence iff  $(d_1, \dots, d_{n-d_n-1}, d_{n-d_n} - 1, \dots, d_{n-1} - 1)$  is a degree sequence

### example

given

$\rightarrow (2, 2, 2, 2, 3, 3, 4) \rightarrow (2, 1, 1, 2, 2, 2)$

### proof

$\Rightarrow$  careful vertex deletion

$$\Leftarrow \text{let } G \text{ have a degree sequence } * \text{ then } \deg(v_i) = \begin{cases} d_i & i = 1, \dots, n - d_n - 1 \\ d_i - 1 & i = n - d_n, \dots, n - 1 \end{cases}$$

add a vertex to  $G$  and add edges between the new vertex and all vertices of degree  $d_i - 1$

the degree of the new vertex is  $n - 1 - (n - d_n) + 1 = d_n$

the new graph has degree sequence  $(d_1, \dots, d_n) \square$

### claim

havel-hakimi can be used to verify, refute the degree sequenceness of any nondecreasing sequence of integers

i.e. we can say rather quickly that (polynomial time) if  $(2, 3, 3, 5, 5, 5, 5, 5, 6)$  is graphical

$n = 10, 10 - 6 - 1 = 3, d_3 = 3, n - d_n = 4, d_4 - 1 = 4, d_9 - 1 = 5 (2, 3, 3, 4, 4, 4, 4, 4, 4) \cdots \rightarrow \dots (1, 1, 2, 2, 2, 2)$

question, if two degree sequences are the same, are the graphs isomorphic? no!
