HW 16

Lesson 10 exercise 3. Find the cosine transform  $U(\omega, t)$  of the solution  $u(x, t)$

Solve by means of the sine *or* cosine transform

PDE	$u_t = \alpha^2 u_{xx}$	$0 < x < \infty$
BC	$u_x(0, t) = 0$	$0 < t < \infty$
IC	$u(x, 0) = H(1 - x)$	$0 \leq x < \infty$

where  $H(x)$  is the *Heaviside function*:

$$H(x) = \begin{cases} 0 & 0 \leq x < 1 \\ 1 & 1 \leq x \end{cases}$$

*Note:* The text is wrong. The above is actually the function  $H(1 - x)$  not the function  $H(x)$ .

$\mathcal{F}_c[u_t] = \alpha^2 \mathcal{F}_c[u_{xx}]$	
$\mathcal{F}_c[u_t] = \frac{2}{\pi} \int_0^\infty u_t \cos(\omega x) \, dx$	$\mathcal{F}_c[u_{xx}] = \frac{2}{\pi} \int_0^\infty u_{xx} \cos(\omega x) \, dx$
$= \frac{\partial}{\partial t} \left[ \frac{2}{\pi} \int_0^\infty u \cos(\omega x) \, dx \right]$	$= -\frac{2}{\pi} u_x'(0, t) - \omega^2 \mathcal{F}_c[u]$
$= \frac{d}{dt} \mathcal{F}_c[u] = \frac{d}{dt} U(t)$	$= -\omega^2 U(t)$
$\frac{dU}{dt} = \alpha^2 [-\omega^2 U(t)]$	$\mathcal{F}_c[u(x, 0)] = \frac{2}{\pi} \int_0^\infty H(1 - x) \cos(\omega x) \, dx$
$U' + \omega^2 \alpha^2 U = 0$	$= \frac{2}{\pi} \int_0^1 \cos(\omega x) \, dx$
$\mu = e^{\int (\omega \alpha)^2 \, dt}$	$= \frac{2}{\pi} \left[ \frac{\sin(\omega x)}{\omega} \right]_0^1$
$= e^{(\omega \alpha)^2 t}$	$U(0) = \frac{2}{\pi} \frac{\sin(\omega)}{\omega}$
$e^{\omega^2 \alpha^2 t} U = \int 0 \, dt$	$U(t) = c_1 e^{-\omega^2 \alpha^2 t}$
$U(0) = c_1 e^0 = c_1 = \frac{2}{\pi} \frac{\sin(\omega)}{\omega}$	$U(t) = \frac{2}{\pi} \frac{\sin(\omega)}{\omega} e^{-\omega^2 \alpha^2 t}$
